## Solution Tite 3, Physics -2 (15 B11 PH211) 2021

Ege 1

1 Marwell's equations:

$$\oint_{S} \vec{E} \cdot d\vec{a} = \frac{Q_{lonc}}{\varepsilon_{0}}, \quad \nabla \cdot \vec{E} = \frac{f}{\varepsilon_{0}}$$

$$\oint_{S} \vec{B} \cdot d\vec{a} = 0, \quad \nabla \cdot \vec{B} = 0$$

$$\oint_{S} \vec{E} \cdot d\vec{l} = -\frac{1}{2} \int_{S} \vec{B} \cdot d\vec{a}, \quad \nabla \times \vec{E} = -\frac{3\vec{B}}{3t}$$

$$\oint_{S} \vec{B} \cdot d\vec{l} = u_{0} I_{lonc} + u_{0} \varepsilon_{c} \vec{d} \vec{E} \cdot d\vec{a}, \quad \nabla \times \vec{B} = u_{0} \vec{J} + u_{0} \varepsilon_{0} \frac{3\vec{E}}{3t}$$

@ Boundary Conditions:

(3) 
$$B_T^1 = B_T^3$$
 (1)  $\frac{1}{1}B_{11}^1 - \frac{1}{1}B_{21}^3 = \frac{K^4 \times y}{1}$   
(1)  $E'E_T^1 - E^3 E_T^3 = d$  (3)  $E'_{11} = E_{11}^3$ 

$$\begin{array}{ll}
\Phi & \nabla^2 V = 0 \\
\frac{1}{r^2} \frac{\partial}{\partial r} \left( r^2 \frac{\partial V}{\partial r} \right) = 0 \\
r^2 \frac{\partial V}{\partial r} = A \\
V = -\frac{A}{r} + B
\end{array}$$

Boundary conditions: V = -25V at 8 = 0.02 m and V = 150V at 8 = 0.35 m $\therefore -25 = -\frac{A}{0.02} + 8$  and  $150 = -\frac{A}{0.35} + 8$ 

Solving 
$$A = 3.716$$
 and  $B = 160.61$  V  
 $V = \frac{-3.71}{x} + 160.61$ 

$$\vec{E} = -\nabla V = -\frac{dV}{dr} = -\frac{d}{dr} \left( \frac{-3.71}{r} + 160.61 \right) \hat{r} \quad (V/m)$$

$$\vec{E} = -\frac{3.71}{r^2} \hat{r} \quad V/m$$

$$\vec{B} = \mathcal{E} \vec{E} = \mathcal{E}_{s} \mathcal{E}_{s} \vec{E} = 8.86 \times 10^{-12} \frac{C^{2}}{N \cdot m^{2}} \times 3.12 \times \left(-\frac{3.71}{v^{2}}\right) \hat{\tau}$$

$$\vec{B} = -\frac{0.103}{v^{2}} \hat{\tau} \left(\frac{mC}{m^{2}}\right)$$

For conductor surface, DI= o

at 
$$r = 0.02 \text{ m}$$
,  $\sigma = \frac{-0.103}{r^2} = \frac{-0.103}{(0.02)^2} = -256 \text{ nc/m}^2$   
at  $r = 0.35 \text{ m}$ ,  $\sigma = \frac{+0.103}{(0.35)^2} = +0.837 \text{ nc/m}^2$ 

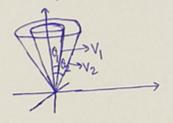

(5) The potential is constant with rand of. Laplace's eq. becomes

$$\nabla^{2}V = 0$$

$$\frac{1}{r^{2}\sin\theta} \frac{d}{d\theta} \left( \sin\theta \frac{dV}{d\theta} \right) = 0$$

$$\sin\theta \frac{dV}{d\theta} = A$$

$$V = A \ln(\tan\frac{\theta}{2}) + B$$

Boundary conditions:  $V=V_1$  at  $\theta=\theta_1$  and V=0 at  $\theta=\theta_2$ 

$$V_{1} = A \ln \left(\tan \frac{\theta_{1}}{2}\right) + B \text{ and } 0 = A \ln \left(\tan \frac{\theta_{2}}{2}\right) + B$$

$$B = -A \ln \left(\tan \frac{\theta_{2}}{2}\right) \text{ and } A = \frac{V_{1}}{\ln \left(\tan \frac{\theta_{1}}{2}\right) - \ln \left(\tan \frac{\theta_{2}}{2}\right)}$$

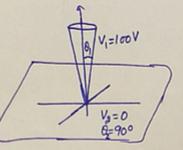

$$B = -\frac{V_{1} \ln \left(\tan \frac{\theta_{1}}{2}\right) - \ln \left(\tan \frac{\theta_{2}}{2}\right)}{\ln \left(\tan \frac{\theta_{1}}{2}\right) - \ln \left(\tan \frac{\theta_{2}}{2}\right)}$$

$$V = V_1 \frac{\ln \left(\tan \frac{\theta_1}{2}\right) - \ln \left(\tan \frac{\theta_2}{2}\right)}{\ln \left(\tan \frac{\theta_1}{2}\right) - \ln \left(\tan \frac{\theta_2}{2}\right)}$$

Now V1 = 100 V at 0,= 100 and 0, = 900

$$\therefore V = 100 \frac{\ln(\tan \frac{0}{3})}{\ln(\tan 5^{\circ})}$$

$$\vec{E} = -\nabla V = -\frac{1}{r} \frac{dV}{d\theta} \hat{\theta}$$

$$\vec{E} = -\frac{100 \left(\frac{1}{2}\right)}{r \left(\tan \frac{\theta}{2}\right) \left(\cos^2 \frac{\theta}{2}\right) \ln(\tan 5^\circ)} \hat{\theta} = -\frac{100}{\left(r \sin \theta\right) \ln(\tan 5^\circ)} \hat{\theta}$$

$$\vec{E} = \frac{41.05}{7Sin\theta} \hat{\theta}$$

$$\vec{D} = \varepsilon_0 \vec{E} = \frac{3.63 \times 10^{-10}}{7Sin\theta} \hat{\theta} \quad (c/m^2)$$

For Q=90° plane, Sin0=1 and direction of D' points in -2. (000+=0)

$$\sigma = -\frac{3.63 \times 10^{-30}}{7} (c/m^2)$$

$$\vec{E}(r,t) = \frac{l_0 I_0 \omega}{2\pi} Sin(\omega t) ln(\frac{a}{r}) \hat{z}$$

(b) 
$$I_{d} = \int \vec{J}_{d} \cdot d\vec{a} = \frac{\mu_{0} \mathcal{E}_{0} \omega^{2}}{g^{2} H} \int_{0}^{a} I \ln \left(\frac{a}{r}\right) \left(g_{H} r dr\right)$$

$$= \mu_{0} \mathcal{E}_{0} \omega^{2} I \int_{0}^{a} \left(r \ln a - r \ln r\right) dr$$

$$= \mu_{0} \mathcal{E}_{0} \omega^{2} I \int_{0}^{a} \left(\ln a\right) \frac{\pi^{2}}{2} - \frac{r^{2}}{2} \ln r + \frac{r^{2}}{4} \int_{0}^{a}$$

$$= \mu_{0} \mathcal{E}_{0} \omega^{2} I \left[\frac{a^{2}}{2} \left(\ln a\right) - \frac{a^{2}}{2} \left(\ln a\right) + \frac{a^{2}}{4}\right]$$

$$T_{0} = \mu_{0} \mathcal{E}_{0} \omega^{2} I a^{2}$$

$$\overline{I}_{d} = \underbrace{ll_0 \varepsilon_0 \omega^2 I a^2}_{U}$$

$$\bigcirc \quad \underline{I}_{\underline{I}} = \underline{\mu_0 \varepsilon_0 \omega^2 a^2} = (\underline{\omega a}_{2c})^2$$

7

Magnetic field between the cylinders is  $\vec{\beta} \vec{B} \cdot d\vec{a} = \vec{B} (3\pi \tau) = 16\vec{I} \hat{\phi}$   $\Rightarrow \vec{B} = \frac{16\vec{I}}{3\pi \tau} \hat{\phi}$ 

9f 9 is the charge per unit length them electric field between the cylinders is β E.da = Qenc ⇒ E (2πrl) = 21 ⇒ E = 2πεο + 8

$$\vec{S} = \frac{1}{I_{0}}(\vec{E} \times \vec{B}) = \frac{9I}{4\pi^{2} \mathcal{E}_{0} r^{2}} \hat{z}$$

$$P = \int \vec{S} \cdot d\vec{a} = \int_{0}^{\pi} \int_{0}^{b} \left( \frac{9I}{4\pi^{2} \mathcal{E}_{0} r^{2}} \hat{z} \right) \cdot \left( r dr d\phi \hat{z} \right) = \frac{9I}{4\pi^{2} \mathcal{E}_{0}} (2\pi) \int_{a}^{b} \frac{dr}{r}$$

$$P = \frac{\Im I}{\Im \pi \varepsilon_0} \ln(\frac{b}{a})$$

$$V = \int_a^b \vec{E} \cdot d\vec{l} = \frac{\Im}{\Im \pi \varepsilon_0} \int_a^b \frac{1}{r} dr = \frac{\Im}{\Im \pi \varepsilon_0} \ln(\frac{b}{a})$$
and 
$$P = IV = \frac{\Im I}{\Im \pi \varepsilon_0} \ln(\frac{b}{a})$$
